

# The House Fly

Every creature goes through different stages in its life. The female fly lays 250 eggs that look like white grains of rice. Within 24 hours the egg becomes a pale white larva that looks like a worm. The larva eats and grows for five days until it changes into a pupa. The pupa changes into a fly in 3-6 days and within 2-3 days the female is ready to lay eggs! Look at the lifecycle drawing below. Fill in the missing information.

LIFE CYCLE OF THE HOUSE FLY
